

This submission includes all of our planned automation testing, and it seems to accurately test for the React framework and 3 browsers (chromium, Firefox and Safari).

You will find that every single test is running with 2 for loops at the start, one for browsers and one for frameworks. This was our attempt to run every test on all browsers and as many of the frameworks from the TodoMVC website as possible.

We realise having 2 for loops in each of the tests is a very 'brute force' way of running our tests and potentially might even cause interference between them.

The framework list called in one of the loops now only contains the "React" string as an element because as we tested different frameworks we kept finding more examples of incompatibility with our tests, so we put these aside.

We meant to leave only the browser loop in the tests but given the time of submission we figured it wouldn't really hurt to leave the other loop if we explained the reason why (which is really just us being tired of adding loops only to remove them now).

I think we are quite happy with our tests overall and the only frustration really came from trying to find a way to remove the loops from inside our tests (potentially a test suite might help with that?).
